SUMMARY

Frontend engineer with full-stack reach and 4+ years of experience building enterprise data marketplace platforms and e-commerce applications. Experienced in AI-integrated systems including RAG pipelines, LangGraph agents, and vector search. Has shipped consistent improvements to performance, test coverage, and team productivity through structured AI tooling adoption. Takes ownership from architecture decisions through to production.

EXPERIENCE

Software Engineer II — Hashedin

Oct 2023 – Present · Hyderabad, India

- Led 4 engineers on an enterprise data marketplace with micro-frontends, including an AI chat interface that generates metric definitions from data products for non-technical users.
- Built the full data product lifecycle from scratch covering role-based workflows, permissions, and dynamic form validation with real-time error feedback. Reduced data product onboarding time by 3x.
- Reduced JS bundle size by 45% through code splitting and lazy loading, set up Lighthouse CI budgets that kept Core Web Vitals above 85 and brought page load time down by 20%.
- Introduced GitHub Copilot and Claude Code across the team with adoption guidelines, increasing team velocity.

Software Engineer I — Hashedin

Aug 2022 – Sep 2023 · Bangalore, India

- Built and deployed 15+ GCP serverless functions with GitHub Actions CI/CD, eliminating manual deployments and streamlining frontend-backend integration.
- Redesigned checkout UX with progressive disclosure, reducing payment abandonment by 15%.
- Fixed keyboard navigation, focus management, and ARIA across modal components to meet WCAG 2.1 AA, resolving 95% of accessibility issues.

PROJECTS

Codesense — AI Developer Profiler

[View on GitHub](#)

[LangGraph](#) · [FastEmbed](#) · [PostgreSQL](#) + [pgvector](#) · [Celery](#) · [FastAPI](#) · [React](#)

- Indexed all repos in parallel using celery.group and streamed live progress through Redis pub/sub to a WebSocket. Each repo is health-graded A/B/C across 13 signals: tests, CI, Docker, license, and commit activity.
- Built a RAG pipeline over source code: fastembed embeds questions locally at zero API cost, pgvector retrieves the top 8 chunks, and Groq llama-3.3-70b streams JSON over SSE with a character-by-character typing effect.
- Wrote a 4-node LangGraph agent that pre-computes skill scores at index time with zero LLM tokens. Scores feed into every RAG prompt and model JSON drives a React component registry of commit heatmaps, skill radars, and timelines.

API Rate Limiter

[View on GitHub](#)

[Python](#) · [FastAPI](#) · [Redis](#) · [Lua](#) · [Docker](#) · [Prometheus](#) · [pytest](#)

- Built 4 rate limiting algorithms (fixed window, sliding window, token bucket, leaky bucket) as pluggable FastAPI middleware with a `@rate_limit` decorator supporting per-IP, per-API-key, and per-user scoping.
- Eliminated race conditions using atomic Redis Lua scripts and verified zero over-admission under 500 concurrent asyncio requests across all algorithms.
- Shipped a Prometheus metrics endpoint and live Chart.js dashboard alongside 79 unit tests and a Locust load test suite.

SKILLS

Frontend:	JavaScript, TypeScript, React.js, Next.js, Redux, Zustand, TanStack Query, React Hook Form, GraphQL
Backend:	FastAPI, Node.js, Express.js, PostgreSQL, Redis, SQLAlchemy, Alembic, Celery, asyncio, WebSockets, OAuth2/JWT
Architecture:	LangGraph, RAG pipelines, pgvector, Micro Frontends, PWAs, Performance Optimization, Lighthouse
Testing & build:	Jest, React Testing Library, Playwright, Cypress, Pytest, Locust, Prometheus, Webpack, Vite
DevOps:	Docker, Kubernetes, GitHub Actions, CI/CD, AWS, GCP

EDUCATION

B.Tech in Computer Science — Sree Vidyanikethan Engineering College, Tirupati

Aug 2018 – May 2022

CERTIFICATIONS

- AWS Certified Solutions Architect – Professional
- GCP Professional Cloud DevOps Engineer
- Generative AI RAG Framework — Google Cloud Skill Badge
